

Designation: C1172 – 19

# Standard Specification for Laminated Architectural Flat Glass<sup>1</sup>

This standard is issued under the fixed designation C1172; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reappraisal. A superscript epsilon ( $\epsilon$ ) indicates an editorial change since the last revision or reappraisal.

## 1. Scope\*

1.1 This specification covers the quality requirements of flat laminated glass consisting of two or more lites of glass bonded with an interlayer material for use in building and related applications.

1.2 Depending on the number, thickness, and treatment of lites, and the number and thickness of interlayers, the glass shall be laminated for applications including, but not limited to, safety, security, detention, hurricane/cyclic-wind resistance, blast resistance, bullet resistance, sound reduction, and decorative glazing.

1.3 Optical distortion and the evaluation thereof are not currently within the scope of the standard. Mockups are recommended as a method to evaluate glass. (See [Appendix X1](#).)

1.4 The dimensional values, except thickness designations, stated in inch-pound units are to be regarded as the standard. The values in parentheses are for information only.

1.5 The following safety hazards caveat pertains only to the test method portion, Section 7, of this specification: *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety, health, and environmental practices and determine the applicability of regulatory limitations prior to use.*

1.6 *This international standard was developed in accordance with internationally recognized principles on standardization established in the Decision on Principles for the Development of International Standards, Guides and Recommendations issued by the World Trade Organization Technical Barriers to Trade (TBT) Committee.*

### 3. Terminology

3.1 *Definitions*:

3.1.1 Refer to Terminology C162, Specifications C1036 or C1048, as appropriate.

3.1.2 *blemishes in flat glass*—Refer to Specifications C1036 or C1048, as appropriate.

3.2 *Definitions of Terms Specific to This Standard*:

3.2.1 *adhesion chips*—See *fuse*.

3.2.2 *blow-in*—a separation of glass and interlayer at or close to the laminate edge caused by penetration of the autoclaving medium into the edge during manufacturing.

3.2.3 *boil (bubble)*—a gas pocket in the interlayer material or between the glass and interlayer.

3.2.4 *covered edge*—the peripheral area of the laminate covered by the channel or sash when installed.

3.2.5 *delamination*—a condition in which separation has occurred between the glass lite(s) and the interlayer.

3.2.6 *discoloration*—a visibly noticeable color change (from original) in the appearance of a material.

3.2.7 *distortion*—the inability to see an image clearly; the image is twisted out of natural shape.

3.2.8 *edge boil*—See *boil (bubble)*.

3.2.9 *exposed edge*—the peripheral area of the laminate exposed to the environment after installation.

3.2.10 *fuse*—a glass particle or crystalline material that is permanently bonded to a surface of a lite.

3.2.11 *hair*—a slender, pigmented filament from human or animal epidermis or other thread-like filament.

3.2.12 *inside dirt*—foreign material trapped inside the laminate.

3.2.13 *interlayer*—a layer or multiple layers of material acting as an adhesive between lites of glass which add(s) additional performance to the finished product, for example, impact resistance, solar control, acoustical insulation, color, design, or combinations thereof.

3.2.14 *laminated glass*—an assembly consisting of two or more lites of glass, conforming to Specifications C1036 or C1048, that are bonded together by interlayer material.

3.2.15 *lint*—short fibers of yarn or fabric trapped within the laminate.

3.2.16 *lite or light*—a panel or sheet of glass or a panel or sheet of laminated glass.

3.2.17 *mismatch*—misalignment of the edges of two lites of glass, when laminated.

3.2.18 *offset*—glass lites that are intentionally not aligned in a laminate.

3.2.19 *rub*—abrasion of a glass surface producing a frosted appearance; also known as a scuff.

3.2.20 *separation*—an area of the laminate that has become delaminated (see *delamination*).

3.2.21 *shiner*—an area on a glass edge that has not been ground or polished.

3.2.22 *short interlayer*—a condition of the laminate in which the interlayer does not extend to the edge.

3.2.23 *streak*—a noticeably visible directional blemish or discoloration on or in the laminated unit.

3.2.24 *template*—a pattern used as a guide to define the overall size and shape of a cut lite.

3.2.25 *unlaminated area*—an area of the laminate that failed to flow, develop acceptable optics, achieve adhesion, or combinations thereof during the laminating process. This blemish may be discernible due to a texture, haze, or other change in appearance.

### 4. Classification

4.1 *Type*—Laminated flat glass furnished under this specification shall be of the following types, as specified:

4.1.1 *Type I - Laminated Glass*—An assembly consisting of two or more lites of glass, conforming to Specifications C1036 or C1048, that are bonded together by interlayer material.

4.1.2 *Type II - Laminated Safety Glass*—An assembly of two or more lites of flat glass, conforming to Specifications C1036 or C1048, that are bonded together by interlayer material that meet the requirements of ANSI Z97.1 or CPSC 16CFR1201. In the case of breakage, the interlayer serves to retain the glass fragments, limit the size of the opening and reduce the risk of cutting or piercing injuries.

4.2 *Application*—The following terms are designed to guide the user to the appropriate inspection charts and requirements. The glazing can usually, but not always, be viewed in transmittance and reflectance.

4.2.1 *Laminated Proximate Glazing*—Glazing used in an installation in which the lower edge of the glazing is a maximum of 6 ft (1.8 m) above the walking surface. The glazing is usually vertical, however, may also be sloping in or out from the vertical plane. The glazing can be approached within 10 ft (3 m) or less (if distance is greater than 10 ft (3 m) see *Laminated Overhead Glazing*). Interior decorative glazing will be judged according to laminated vertical glazing criteria.

4.2.2 *Laminated Overhead Glazing*—Glazing used in an installation in which the lower edge of the glass is more than 6 ft (1.8 m) above a walking floor level or cannot be approached within 10 ft (3 m). The glazing is usually sloping from the vertical plane, however, may also be vertical. Sloped
