**Belt drives — Dynamic test to determine
pitch zone location —**

Part 1:
V-belts

*Transmissions par courroies — Méthode d'essai dynamique de
détermination de l'emplacement de la zone primitive d'une courroie —
Partie 1: Courroies trapézoïdales*

Reference number
ISO 8370-1:1993(E)

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

International Standard ISO 8370-1 was prepared by Technical Committee ISO/TC 41, *Pulleys and belts (including veebelts)*, Sub-Committee SC 1, *Veebelts and grooved pulleys*.

This first edition of ISO 8370-1, together with ISO 8370-2, cancels and replaces ISO 8370:1987, which has been technically revised.

ISO 8370 consists of the following parts, under the general title *Belt drives — Dynamic test to determine pitch zone location*:

- Part 1: *V-belts*
- Part 2: *V-ribbed belts*
