

Standard Guide for Personnel Training for Health and Safety Aspects of Working in Environments Containing Respirable Silicon Carbide Whiskers¹

This standard is issued under the fixed designation E 1717; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last approval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

^{ε1} NOTE—Title was changed editorially October 1995.

1. Scope

1.1 This guide presents guidance on training and information that should be transmitted to employees that work with, or may be exposed to, airborne respirable silicon carbide whiskers in the course of their job assignments.

1.2 Transfer of workplace health and safety information is referred to as hazard communications and there are specific OSHA regulations that govern some aspects of the activity. This guide is intended to present information that relates to silicon carbide whiskers. It does not address nor take the place of regulatory requirements such as the OSHA Hazard Communication Standard.

1.3 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

2. Referenced Documents

2.1 ASTM Standards:

E 1437 Practice for Handling Silicon Carbide Whiskers²

E 1451 Guide for Disposal of Wastes Containing Silicon Carbide Whiskers and Fibers²

E 1716 Guide for Selection and Use of Personal Protective Equipment for Humans Working with Respirable Silicon Carbide Whiskers²

2.2 OSHA Standard:

Title 29 CFR 1910.1200 Hazard Communication³

3. Terminology

3.1 Definition:

3.1.1 *respirable silicon carbide whiskers and fibers*—a crystalline silicon carbide material, approximately cylindrical in shape, with an aspect ratio equal to or greater than 5, and a

diameter less than 3.0 μm with the potential to become airborne.

4. General Considerations for Health and Safety Training for Silicon Carbide Whiskers

4.1 All individuals with significant potential for exposure to airborne silicon carbide whiskers and individuals that routinely work with silicon carbide whiskers should be provided with information and training needed to perform their work safely and to understand the nature of the specific hazards of silicon carbide whiskers. It is recommended that Practice E 1437, Guides E 1451 and E 1716, and the OSHA Standard for Hazard Communication be reviewed with employees as part of the training program.

4.2 Training should be provided prior to initial assignment.

4.3 It is recommended that training efforts be documented. This may be accomplished by retaining training outlines and rosters as records of training.

4.4 Training should be interactive to the extent necessary to ensure that those being trained understand the information provided.

4.5 A key source for current safety information on materials is the manufacturer's material safety data sheets (MSDS).

5. Health and Safety Training Program Content

5.1 Employees should be instructed in the methods for recognition of silicon carbide whiskers in their work areas.

5.2 Employees should be given current information on the potential health effects from exposure to silicon carbide whiskers as follows:

5.2.1 The current status of whiskers as a suspect carcinogen, this being based primarily on animal studies and no human data. The monograph on the evaluation of carcinogenic risks to humans should be reviewed.⁴

5.2.2 The similarity of potential health effects to those resulting from exposure to asbestos.

5.2.3 The possibility that smoking may increase the risk of
