Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

International Standard ISO 5845-2 was prepared by Technical Committee ISO/TC 10, *Technical drawings, product definition and related documentation*, Subcommittee SC 6, *Mechanical engineering documentation*.

ISO 5845 consists of the following parts, under the general title *Technical drawings — Simplified representation of the assembly of parts with fasteners*:

- Part 1: *General principles*
- Part 2: *Rivets for aerospace equipment*

Introduction

ISO 5845 has been devised to provide a universal means of communication among the various parties involved in the design and manufacture, in general, as well as the installation of fasteners.

The representation of rivets on technical drawings should conform to one of the following two methods, which must meet requirements for micro-copying and reproduction:

- a) conventional drawing of rivets (according to ISO 128); this method is particularly suitable for drawings containing a small number of rivets, or when the use of symbols may not provide complete understanding.
- b) symbolic representation; this method is best suited to drawings containing a large number of rivets (see clause 4).

Requirements within industries vary considerably; in recognition of this fact, ISO 5845 is presented in two parts. Part 1 is mainly devoted to structural metal work. Part 2 is mainly devoted to aerospace equipment. Both are recommended for application to other fields as well.
