Procedures for Routine Performance Tests of Steam Turbines

(Not Intended for Acceptance Testing)

ASME PTC 6S Report-1988

[REVISION OF ASME PTC 65 REPORT-1970 (R1985)]

PERFORMANCE TEST CODES

THE AMERICAN SOCIETY OF MECHANICAL ENGINEERSUnited Engineering Center345 East 47th StreetNew York, N.Y. 10017

Date of Issuance: December 15, 1989

This document will be revised when the Society approves the issuance of the next edition, scheduled for 1992. There will be no Addenda issued to PTC 6S Report-1988.

Please Note: ASME issues written replies to inquiries concerning interpretation of technical aspects of this document. PTC 6S Report-1988 is being issued with an automatic subscription service to the interpretations that will be issued to it up to the publication of the 1992 Edition.

ASME is the registered trademark of The American Society of Mechanical Engineers.

This code or standard was developed under procedures accredited as meeting the criteria for American National Standards. The Consensus Committee that approved the code or standard was balanced to assure that individuals from competent and concerned interests have had an opportunity to participate. The proposed code or standard was made available for public review and comment which provides an opportunity for additional public input from industry, academia, regulatory agencies, and the public-at-large.

ASME does not "approve," "rate," or "endorse" any item, construction, proprietary device, or activity.

ASME does not take any position with respect to the validity of any patent rights asserted in connection with any items mentioned in this document, and does not undertake to insure anyone utilizing a standard against liability for infringement of any applicable Letters Patent, nor assume any such liability. Users of a code or standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, is entirely their own responsibility.

Participation by federal agency representative(s) or person(s) affiliated with industry is not to be interpreted as government or industry endorsement of this code or standard.

ASME accepts responsibility for only those interpretations issued in accordance with governing ASME procedures and policies which preclude the issuance of interpretations by individual volunteers.

No part of this document may be reproduced in any form, in an electronic retrieval system or otherwise, without the prior written permission of the publisher.

FOREWORD

(This Foreword is not part of ASME PTC 6S Report-1988.)

Users of both large and small turbines have experienced an increasing need for procedures for routine turbine tests which trend performance with time. The use of full-scale ASME Performance Test Code procedures and instrumentation for this purpose is expensive and produces information and accuracy beyond that necessary for periodic monitoring. When ASME Performance Test Code Committee No. 6 was reorganized to revise PTC 6-1949, it was charged also with developing simplified procedures for periodic tests. Because of the routine nature of the tests, these procedures were to emphasize repeatability of results rather than absolute accuracy and thus provide a more economic means of monitoring performance trends.

This Report reflects the consensus of knowledgeable engineers and contains recommended procedures for collecting sufficiently accurate data to permit analyses of performance trends. Recommendations are given which include advance planning, cycle isolation, and suggested presentation of results. Emphasis is placed upon the use of accurate instrumentation, approaching measurement uncertainties required by the Code, for the measurement of critical variables that are part of the heat-rate equation. Other instrumentation is specified to produce results of good accuracy and of a high degree of repeatability. With the application of automatic data-logging and on-line computer systems to the plant cycle, the procedures presented in this Report, when applied to this end, should satisfy the needs of users of both large and small turbines.

Procedures recommended in this Report are not intended to produce abolute levels of performance. If absolute performance level is required, the ASME Test Code for Steam Turbines, PTC 6, 1976, reaffirmed 1985, or the Interim Test Code for an Alternative Procedure for Testing Steam Turbines, PTC 6.1, 1984, should be followed. For other levels of accuracy, where the test instrumentation varies from the Test Code specified procedure, the Report by PTC Committee No. 6 on "Guidance for Evaluation of Measurement Uncertainty in Performance Tests of Steam Turbines," 1985 should be consulted.

Users of this Report are requested to comment and provide to the Committee supporting data obtained with these procedures. Such comment and repeatability data covering long-term and/or extensive experience will provide guidance for subsequent revisions of this Report. User suggestions and data should be submitted to the Secretary, ASME Performance Test Codes Committee, 345 East 47th Street, New York, New York 10017.

This Report was approved by the ASME Board on Performance Test Codes and adopted as a standard practice of the Society on May 8, 1988. It was approved as an American National Standard by the ANSI Board of Standards Review on September 8, 1988.
