

# AEROSPACE RECOMMENDED PRACTICE

ARP5507™

Issued	2002-08
Reaffirmed	2017-09

## Aircraft Tire-to-Wheel Performance Characteristics

### RATIONALE

ARP5507 has been reaffirmed to comply with the SAE Five-Year Review policy.

#### 1. SCOPE:

The performance of an aircraft tire/wheel assembly in service is dependent on the geometrical fit, load distribution, and performance at the tire/wheel interface while rolling. This document focuses on the tire-to-wheel circumferential movement for a new tubeless tire.

#### 2. APPLICABLE DOCUMENTS:

The following publications form a part of this document to the extent specified herein. The latest issue of SAE publications shall apply. The applicable issue of other publications shall be the issue in effect on the date of the purchase order. In the event of conflict between the text of this document and references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

##### 2.1 SAE Publications:

Available from SAE, 400 Commonwealth Drive, Warrendale, PA 15096-0001.

AS4833 Minimum Performance Standard - New Aircraft Tires

##### 2.2 U.S. Government Publications:

Available from DODSSP, Subscription Services Desk, Building 4D, 700 Robbins Avenue, Philadelphia, PA 19111-5094.

SAE Technical Standards Board Rules provide that: "This report is published by SAE to advance the state of technical and engineering sciences. The use of this report is entirely voluntary, and its applicability and suitability for any particular use, including any patent infringement arising therefrom, is the sole responsibility of the user."

SAE reviews each technical report at least every five years at which time it may be revised, reaffirmed, stabilized, or cancelled. SAE invites your written comments and suggestions.

ISO 3324-2 Aircraft tyres and rims - Part 2 Test methods for tyres

## 3. APPLICABILITY:

This recommended practice applies to braked wheel positions using radial or bias tires.

## 4. TECHNICAL BACKGROUND:

### 4.1 General:

Aircraft tire/wheel assemblies must develop friction and load bearing capabilities at the tire-to-wheel interface. The design and dimensional control of the wheel seating surface and the tire bead contact area must support the following functions:

- a. ease of mounting and dismounting, without damage to tire or wheel;
- b. sealing of the tire/wheel interface against inflation pressure loss;
- c. transmitting torque during braking;
- d. sustaining the bending forces of standard deflection and over deflection; and
- e. sustaining side load forces without loss of inflation pressure.

In performing the above functions, tires have been observed to move circumferentially relative to the wheel. Since there is no mechanical lock or fixed alignment between the tire and the wheel at the tire/wheel interface, movement from the initial seated location can occur under certain conditions.

This aerospace recommended practice defines the performance criteria and validation for tire circumferential movement on the rim, in the laboratory, by a static test, as well as a performance assessment in service.
