

**Pipe threads  
for tubes and fittings**  
Parallel internal thread and taper external thread  
Thread dimensions

**DIN**  
**2999**  
Part 1

Whitworth-Rohrgewinde für Gewinderohre und Fittings; zylindrisches Innengewinde und kegeliges Aussengewinde; Gewindemasse

Supersedes November 1975 edition

*In keeping with current practice in standards published by the International Organization for Standardization (ISO), a comma has been used throughout as the decimal marker.*

For connection with International Standard ISO 7/1 – 1982 published by the International Organization for Standardization (ISO), see Explanatory notes.

Dimensions in mm

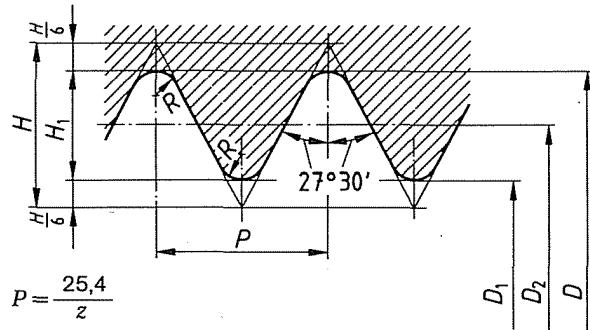

## 1 Field of application

This standard applies to joints between parallel internal threads on valves, fittings, threaded flanges, etc. and taper external threads.

If necessary, a suitable jointing medium may be used on the thread to ensure a tight joint.

## 2 Dimensions, designation

### 2.1 Parallel internal thread (letter symbol Rp)

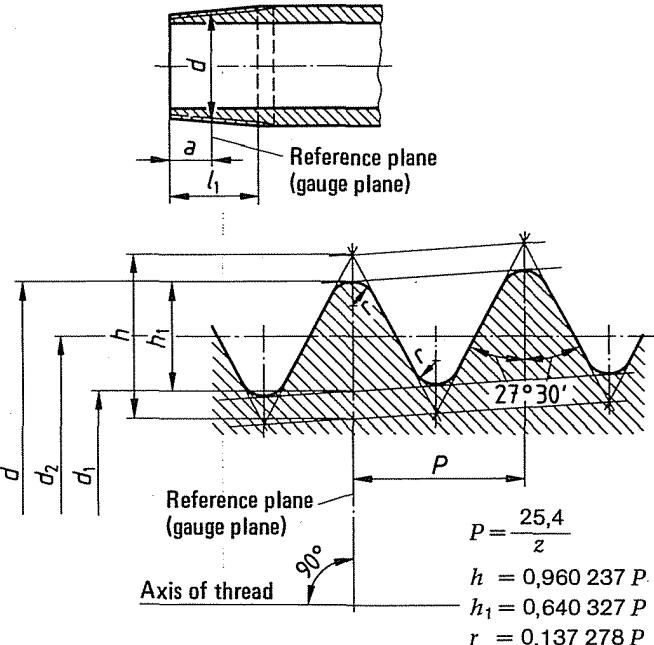

$$H = 0.960\,491\,P$$

$$H_1 = 0.640\,327\,P$$

$$R = 0.137\,329\,P$$

The profile of the parallel internal thread conforms to that of DIN ISO 228 Part 1.

### 2.2 Taper external thread (letter symbol R) (taper 1 : 16)

Designation of an R 1/2 taper external pipe thread:

Pipe thread DIN 2999 – R 1/2

Designation of an Rp 1/2 parallel internal pipe thread:

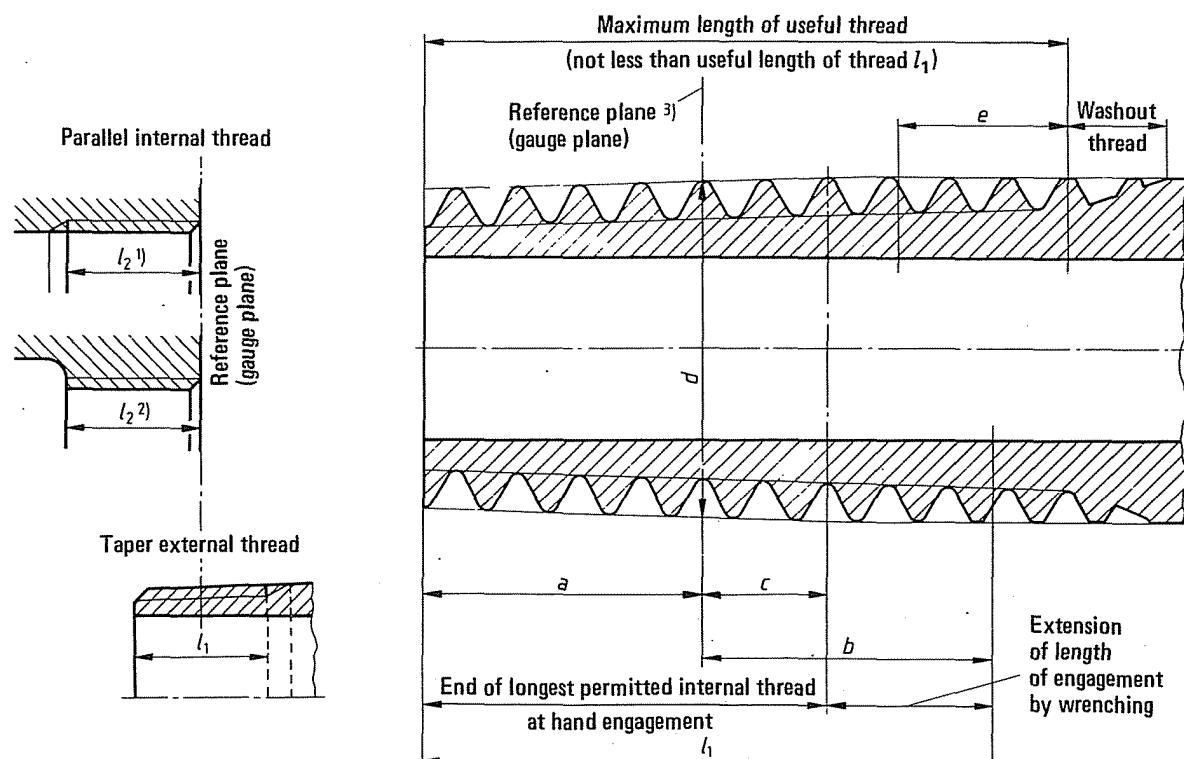

Pipe thread DIN 2999 – Rp 1/2

Continued on pages 2 to 4

Table 1. Nominal dimensions

1	2	3	4	5	6	7	8	9	10	11	12
Thread size		Nominal size of pipe	Gauge length	Outside diameter	Pitch diameter	Minor diameter	Pitch	Number of threads in 25,4 mm Z	Depth of thread	Radius $r = R \approx$	Length of useful thread $l_1$
External thread	Internal thread		a	$d = D$	$d_2 = D_2$	$d_1 = D_1$	P				
R 1/16	Rp 1/16	3	4,0	7,723	7,142	6,561	0,907	28	0,581	0,125	6,5

## Lengths of thread, permissible deviations, limits of sizes

a = distance of gauge plane from start of thread  
 b = mean fitting allowance when using tool

c = extension of length of engagement caused by plus deviation of internal thread  
 e = imperfect thread at tip of thread, due to the minus deviation of the semi-finished product

- 1) An internally threaded part shall make allowance for accommodating a pipe thread up to thread length  $l_1$  for a at maximum.
- 2) With a free run-out, the length  $l_2$  of useful internal thread shall not be less than 80 % of  $l_1$  for a at minimum.
- 3) The dimensions in the reference plane (gauge plane) conform to the nominal dimensions given in table 1.
